

Mystic India Change Report

Date: June 18, 2026

Latest User Prompt

the story card ui appears cluttered put this coming soon in place of slug that we have which appears in bootom right of each card also series side bar appears a bit cartoonish make it standard the point is whole stories page appears cluttered with so many elements also the top of side bar should match the top of stoies cards

Latest Actions

src/components/StoryCard.jsx

- Removed the large centered `Coming Soon` overlay from story thumbnails.
- Moved `Coming Soon` into the card footer near the bottom-right action area.
- Kept story duration visible on coming-soon cards to reduce layout variation.

src/pages/StoriesPage.jsx

- Simplified the series sidebar into a more standard filter rail.
- Removed the decorative sidebar icon and reduced heavy rounded/filled styling.
- Added desktop top offset so the sidebar aligns better with the story content area.
- Verified the page with `npm.cmd run build`.

Summary

The project was moved from static story data in `src/data/stories.js` to dynamic FastAPI + PostgreSQL data, then extended with authentication, separate admin story/category CRUD pages, publish controls, category-filtered story management, PDF links, and an admin analytics dashboard.

Backend Changes

backend/app.py

- Added FastAPI metadata.
- Added CORS for the Vite dev server at `localhost:5173`.
- Kept SQLAlchemy table creation on startup.

backend/config.py

- Added `DATABASE_URL` environment variable support.
- Kept the local PostgreSQL URL as the default fallback.

backend/models.py

- Cleaned SQLAlchemy model formatting.
- Added unique indexed slugs for categories and stories.
- Used existing `User`, `Categories`, and `Stories` tables.

backend/schemas.py

- Added Pydantic response schemas for categories and stories.
- Added request/response schemas for story create/update.
- Added `pdfUrl` to story model/schema/response handling.
- Added request/response schemas for category create/update.
- Added request/response schemas for registration and login.

backend/controllers.py

- Replaced placeholder story endpoint with real database-backed APIs.
- Added story list, detail, related, featured, and search endpoints.
- Added password hashing and signed bearer-token authentication.
- Added admin-only create, update, and delete story endpoints.
- Added admin-only create, update, and delete category endpoints.
- Protected category deletion when stories still belong to that category.
- The first registered user becomes `admin`; later users become `user`.

API Endpoints Added

- `POST /api/auth/register` - register user and return token.
- `POST /api/auth/login` - login user and return token.
- `GET /api/auth/me` - return current authenticated user.
- `GET /api/categories` - return categories with story counts.
- `GET /api/stories?category=all&sort=popular` - return database stories.
- `GET /api/stories/featured?limit=3` - return top stories by popularity.
- `GET /api/stories/{slug}` - return one story by slug.
- `GET /api/stories/{story_id}/related?limit=3` - return related stories.
- `GET /api/search/stories?q=ram` - search title, description, and category.
- `POST /api/admin/categories` - admin creates a category.
- `PUT /api/admin/categories/{category_id}` - admin updates a category.
- `DELETE /api/admin/categories/{category_id}` - admin deletes an empty category.
- `POST /api/admin/stories` - admin creates a story.
- `PUT /api/admin/stories/{story_id}` - admin updates a story.
- `DELETE /api/admin/stories/{story_id}` - admin deletes a story.

Frontend Changes

`src/services/api.js`

- Added fetch helpers for public story/category APIs.
- Added auth helpers for register/login.
- Added admin helpers for create/update/delete stories.
- Added admin helpers for create/update/delete categories.
- Added a publish helper that marks a story as no longer coming soon.
- Supports `VITE_API_BASE_URL`, defaulting to `http://localhost:8000`.

`src/contexts/AuthContext.jsx`

- Added localStorage-backed auth state.
- Exposes current user, token, admin status, login, register, and logout.

`src/pages/AuthPage.jsx`

- Added themed login page.
- Added themed registration page.

- Redirects admins to the admin dashboard and users to story browsing.

src/pages/AdminStoriesPage.jsx

- Added admin story create form.
- Added story list with edit and delete controls.
- Added category filtering to the admin story list so stories are easier to find.
- Added a Publish button for draft/coming soon stories.
- Renamed the video field to `Video URL / Embed Link` to make video publishing clearer.
- Added a `PDF URL` field to story create/edit.
- Added analytics cards for total stories, published stories, coming soon stories, average popularity, and top story.
- Added category coverage analytics showing story count per category.

src/pages/AdminCategoriesPage.jsx

- Added a dedicated admin page for category create, edit, and delete.
- Added a category list showing slug, description, icon, and story count.
- Links back to story management so admin workflows stay separated but easy to access.

HomePage, StoriesPage, StoryDetailPage, SearchBar, useSearch, Navbar, App

- Removed static story imports from main story flows.
- Updated story browsing and search to use backend APIs.
- Changed the Stories page series selector from a dropdown to a sidebar.
- Removed the visible sort dropdown from the Stories page.
- Added auth/admin routes and separate navigation links for story admin and category admin.
- Normal users can read stories. Admins can manage stories.
- Story detail pages show an `Open Story PDF` button when `pdfUrl` exists.

Rollback Options

Recommended: Make a commit before experimenting further, so rollback is easy.

```
git add .
```

```
git commit -m "Add backend story APIs auth and admin CRUD"
```

- To inspect changed files: `git status --short`
- To discard all uncommitted changes and return to the previous checked-out version: `git restore .`
- To remove newly created untracked files after restoring: `git clean -fd`
- To go back after committing: `git revert <commit-hash>`

Careful: `git restore .` and `git clean -fd` can remove local work. Use them only when you are sure you do not need the current edits.

Verification

- `npm.cmd run build` completed successfully after the earlier API/auth/admin work.
- `backend\myenv\Scripts\python.exe -m compileall ...` completed successfully after the earlier API/auth/admin work.
- Backend API responded at `http://127.0.0.1:8000`.
- Frontend responded at `http://127.0.0.1:5173`.

Notes

The backend expects PostgreSQL to be reachable at

`postgresql://postgres:lalit@localhost:5432/mysticindia`, unless `DATABASE_URL` is set.

Your seed script `backend/seed2.py` maps story category slugs to `category_id`, which matches the database relationship.

For real admin file uploads, configure S3/CloudFront first and store returned URLs in `thumbnail`, `videoUrl`, and `pdfUrl`. Direct video upload should use pre-signed S3 URLs so large files do not pass through the FastAPI server.
